Chapter 1 Quick Start

Important safety instructions

To ensure the best from the product, please read this manual carefully. Keep it in a safe place for future reference.

To reduce the risk of electric shock, do not remove the cover from the unit. No user serviceable parts inside. Refer servicing to qualified personnel.

Power and connections

- This unit must be connected to a mains socket outlet with a protective earth connection.
- This unit is not disconnected from the AC power source as long as it is connected to the wall outlet.
- When not using the unit for a long period of time, ensure that the AC power cord is disconnected from the wall outlet.
- The AC wall outlet should be installed near to the unit and be easily accessible.
- Do not plug in or attempt to operate an obviously damaged unit.

General care

- Do not force switches or external connections.
- When moving the unit, disconnect the mains cable and then disconnect the long umbilical cable.
- Do not attempt to clean the unit with chemical solvents or aerosol cleaners, as this may damage the unit. Use a clean dry cloth.
- Do not use around flammable gas. All electrical equipment can generate sparks that can ignite flammable gas.
- Keep away from pets and children. The head has powerful motors that can pinch, so take care not to get your hands trapped in the head or cabling.

- Keep cables tidy. Use cable ties to keep them out of harm's way. If you have a head with slip rings then make use of them; avoid running any cables between the base and the rotating head or camera.

Location

Installation of this unit should be away from sources of excessive heat, vibration, and dust.

Keep the brakes on caster wheels on when using the SLH lift column.

Intellectual property

This product includes confidential and/or trade secret property.

Therefore, you may not copy, modify, adapt, translate, distribute, reverse engineer, or decompile contents thereof.

Overview

Thank you for using the Advanced Freed Box from Mark Roberts Motion Control (MRMC). The Advanced FreeD box can be used to transmit FreeD data packets from the camera both in an MHC system

Connecting the cables

SLH and PTA2 FreeD setup

Ensure that your system consisting advanced FreeD box, SLH and PTA-2 is connected. Make sure that SLH and PTA-2 is supplied with a sync signal source. Make sure the system is powered on before FreeD configuration process. Use the USB cable to connect PC or laptop to the FreeD Box. To simplify the FreeD box configuration, a configuration app can be used with it.

1. Run Freed_Merge_Box.exe file and the following window should appear.

FREED MERGE BOX : VERSION 1.2

Always select port to Open the serial Port Version

Serial_Port Set Board ip:

Set Board's Subnet: Set Board's Gateway:

Source 1 Ip Address: Source 2 Ip Address:

Merge x Merge y Merge Z Not Implemented Board's Port:

No_Of_Destinations

Destination-1 IP: <input type="text"/>	Destination-1 Port: <input type="text"/>
Destination-2 IP: <input type="text"/>	Destination-2 Port: <input type="text"/>
Destination-3 IP: <input type="text"/>	Destination-3 Port: <input type="text"/>
Destination-4 IP: <input type="text"/>	Destination-4 Port: <input type="text"/>
Destination-5 IP: <input type="text"/>	Destination-5 Port: <input type="text"/>
Destination-6 IP: <input type="text"/>	Destination-6 Port: <input type="text"/>
Destination-7 IP: <input type="text"/>	Destination-7 Port: <input type="text"/>

Debug Status

(Only debug status 3 is implemented and always set debug back to 0 after receiving the information)

2. Click on Serial Port button to select serial port of the FreeD box. After that you should see current settings of the FreeD box.

FREED MERGE BOX: VERSION 1.2

Always select port to Open the serial Port Version 9.03

Serial_Port Set Board ip:

Set Board's Subnet: Set Board's Gateway:

Source 1 Ip Address: Source 2 Ip Address:

Merge x Merge y Merge Z Not Implemented Board's Port:

No_Of_Destinations

Destination-1 IP: Destination-1 Port:

Destination-2 IP: Destination-2 Port:

Destination-3 IP: Destination-3 Port:

Destination-4 IP: Destination-4 Port:

Destination-5 IP: Destination-5 Port:

Destination-6 IP: Destination-6 Port:

Destination-7 IP: Destination-7 Port:

Debug Status

(Only debug status 3 is implemented and always set debug back to 0 after receiving the information)

3. Check current settings and make required changes. For example if FreeD box should have IP address 192.168.1.221 and listening port 55535 then type in 192.168.1.221 to the Set Board IP field and 55535 to the Board's Port field

For example if PTA-2 head's IP address is 192.168.1.238, so this IP should be input to the **Source 1 Ip Address** field. If SLH's IP address is 192.168.1.236. Then this IP should be input to the **Source 2 Ip Address** field.

- In PTA-2 + SLH system we merge Z position then Merge Z checkbox should be checked.

For example PC's (for FreeD packets reception) IP Address is 192.168.1.87 and Port is 55535. In that case we populate **Destination-1 IP:** field and **Destination-1 Port:** field accordingly.

The screenshot shows the 'FREED MERGE BOX' application window. At the top, it says 'Always select port to Open the serial Port'. Below this are several input fields and buttons:

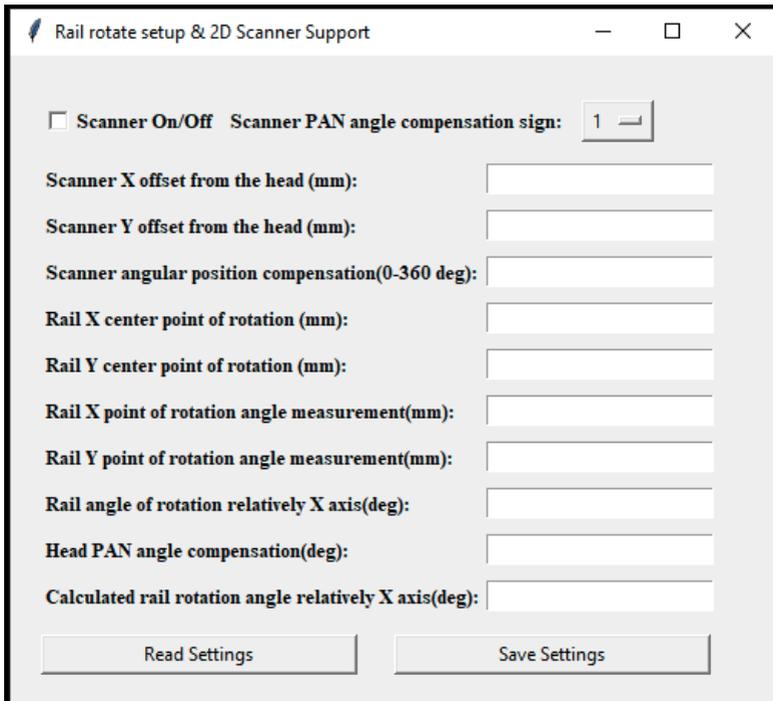

- Serial_Port:** A dropdown menu showing 'COM4' and a 'Click To Refresh Ports' button.
- Set Board ip:** A text input field containing '192.168.1.221'.
- Set Board's Subnet:** A text input field containing '255.255.255.0'.
- Set Board's Gateway:** A text input field containing '192.168.1.1'.
- Source 1 Ip Address:** A text input field containing '192.168.1.238'.
- Source 2 Ip Address:** A text input field containing '192.168.1.236'.
- Board's Port:** A text input field containing '55535'.
- Merge checkboxes:** Three checkboxes labeled 'Merge x', 'Merge y', and 'Merge Z'. 'Merge Z' is checked. A fourth checkbox labeled 'Not Implemented' is unchecked.
- No_Of_Destinations:** A dropdown menu showing '1'.
- Destination-1 IP:** A text input field containing '192.168.1.87'.
- Destination-1 Port:** A text input field containing '55535'.
- Destination-2 IP:** An empty text input field.
- Destination-2 Port:** An empty text input field.
- Destination-3 IP:** An empty text input field.
- Destination-3 Port:** An empty text input field.
- Destination-4 IP:** An empty text input field.
- Destination-4 Port:** An empty text input field.
- Destination-5 IP:** An empty text input field.
- Destination-5 Port:** An empty text input field.
- Destination-6 IP:** An empty text input field.
- Destination-6 Port:** An empty text input field.
- Destination-7 IP:** An empty text input field.
- Destination-7 Port:** An empty text input field.
- Debug Status:** A dropdown menu showing '0'.
- Buttons:** 'Read Settings' and 'Save Settings' buttons.

At the bottom, there is a note: '(Only debug status 3 is implemented and always set debug back to 0 after receiving the information)'

- After checking of the current settings click **Save Settings** button to complete FreeD box IP setup.
- After that close (exit) the app.

Setting up FreeD box offsets and enabling the 2D scanner support

1. Click the **Rail Rotate Setup/2D Scanner Support** button. The following screen should appear.

Rail rotate setup & 2D Scanner Support

Scanner On/Off Scanner PAN angle compensation sign: 1

Scanner X offset from the head (mm):

Scanner Y offset from the head (mm):

Scanner angular position compensation(0-360 deg):

Rail X center point of rotation (mm):

Rail Y center point of rotation (mm):

Rail X point of rotation angle measurement(mm):

Rail Y point of rotation angle measurement(mm):

Rail angle of rotation relatively X axis(deg):

Head PAN angle compensation(deg):

Calculated rail rotation angle relatively X axis(deg):

Read Settings Save Settings

2. Press the **Read Settings** button and the following screen appears.

<input checked="" type="checkbox"/> Scanner On/Off	Scanner PAN angle compensation sign:	1
Scanner X offset from the head (mm):		13.0000
Scanner Y offset from the head (mm):		22.0000
Scanner angular position compensation(0-360 deg):		33.0000
Rail X center point of rotation (mm):		744.0000
Rail Y center point of rotation (mm):		555.0000
Rail X point of rotation angle measurement(mm):		75.0000
Rail Y point of rotation angle measurement(mm):		4.0000
Rail angle of rotation relatively X axis(deg):		555.0000
Head PAN angle compensation(deg):		1.0000
Calculated rail rotation angle relatively X axis(deg):		39.4755°

Read Settings Save Settings

3. Check the Scanner On/Off option.
4. Set **Scanner PAN angle compensation sign** to **1**.

At the factory, the scanner is installed on the Front Leg of the SLH. So, the scanner installation configuration is:

- Front Leg
In this case, assign these values to the following parameters:
Scanner X offset from the head (mm) to 0.0
Scanner Y offset from the head (mm) to -350.0
Scanner angular position compensation (0-360 deg) to 90.0
- If scanner is installed on the rear right leg then use the following settings:
Scanner X offset from the head (mm) to -302.0

Scanner Y offset from the head (mm) to 174.0

Scanner angular position compensation (0-360 deg) to 210.0

- If scanner is installed on the rear left leg then use the following settings:

Scanner X offset from the head (mm) to 302.0

Scanner Y offset from the head (mm) to 174.0

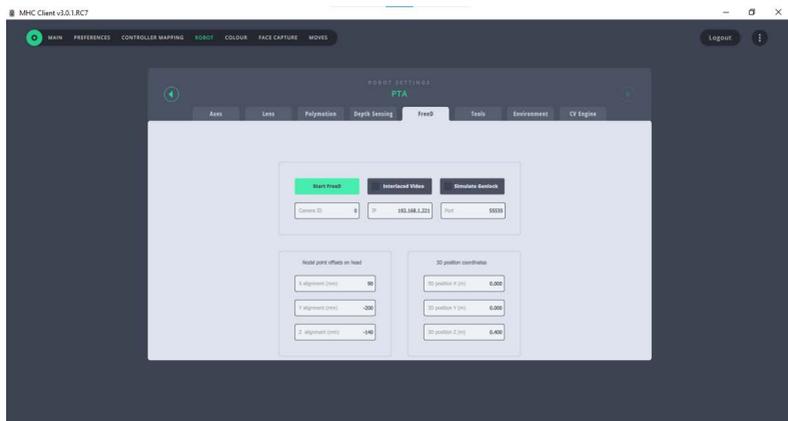

Scanner angular position compensation (0-360 deg) to 330.0

All the remaining fields except the last one (which is read only) should be set to 0.0

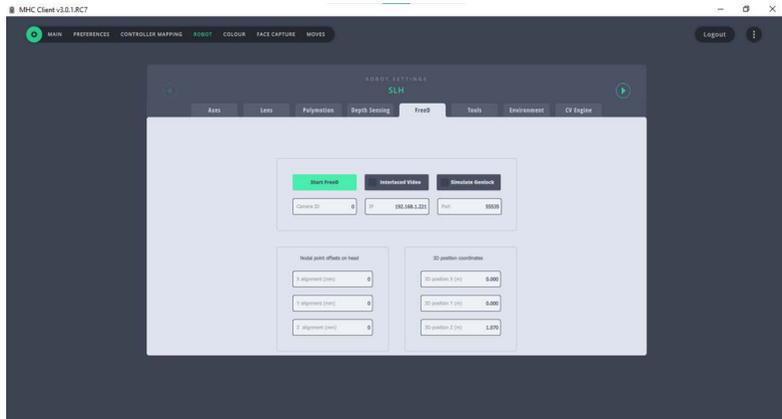

Note that positive PAN angles direction should be CLOCKWISE.

Configuring FreeD Box's IP in MHC for PTA-2 and SLH-1

1. Launch MHC. Log in as Admin. In Network Setup, add the PTA-2 head and add SLH-1 as the 'child' of PTA-2.
2. Log in as 'Engineer' and navigate to **Settings** → **Robot** → **FreeD** for PTA-2 head. Enter FreeD Box IP and its Port to the corresponding fields in MHC for the PTA-2 head. For example,

3. Enter FreeD Box IP and its Port to the corresponding fields in MHC for SLH. For example,

Setting up FreeD offsets in MHC

Setting up Z room offset on SLH.

1. Ensure you got correct scaling factor on the lift column. It might be found in **MHC Server** → **Axis Settings**.

Advanced FreeD Box Quick Start Guide

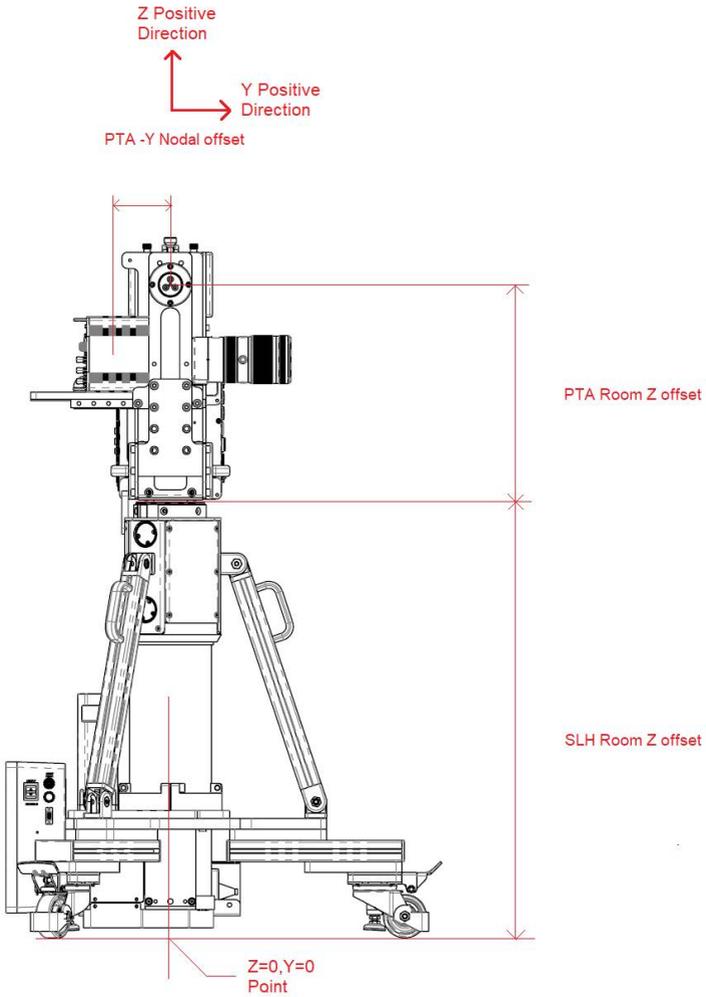

Axis Settings

Motor type:	CAN	Head 1	Connected
Scaling:	1.59781e-05	200	ON
Maximum velocity:	50	Read from RAM	HW: 7, SW:3.58.00 RC39 PV
Maximum acceleration:	90	Read from FLASH	Enable
Change of acceleration:	1	Save to RAM	Disable
Maximum deceleration:	90	Save to FLASH	Override Limits
Change of deceleration:	1	Refresh	Restore Limits
Minimum position:	-221	Restore Axis Settings	SUCCESS
Maximum position:	126	RESET HEAD	Home Zero
Backlash Offset:	0		Direct Zero
Goto Style:	All Axes		-101.237236
Home style:	OPTO VANE		-
Home velocity:	3.12		+
Home time:	60		-101.237236
Home offset:	0 Copy Current		VELOCITY MODE
Restriction Type:	Controller		STOP
Automatic Homing:	No		
Override motor:	Yes		
Signal Gain:	30		
Tacho Gain:	30		
Integral Gain:	20		
Current Limit (mA):	500		
Temperature Limit:	180		
Positional Error Limit:	250		
Stepper Pulse Length:	6		
PWM Type:	Unipolar		
Homing Current:	32223		
PV Filter:	0.99		

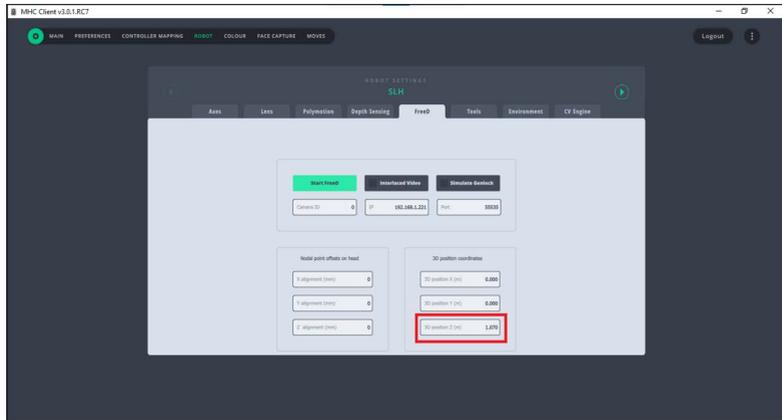

To test scaling factor correctness move the column to 100mm. The current position should be changed to 100 units.

2. Run SLH to it Zero position (using MHC). Use the following diagram to measure SLH Z Room offset in metres using a tape

measure and add it in the **3D Position Z (m)** box for SLH's FreeD tab.

Z Room Offsets

Setting up offsets on PTA-2

1. Ensure you got correct scaling factors on the PAN and TILT Axis.
Use the following MHC Server Axis Settings screens for reference:

PAN

Setting up Z Room Offset on PTA-2

Switch to the PTA head FreeD settings in MHC. Use the above 'Z Room Offsets' diagram to measure the PTA Z Room Offset and enter the value (in metres) in the **3D Position Z (m)** box for the PTA.

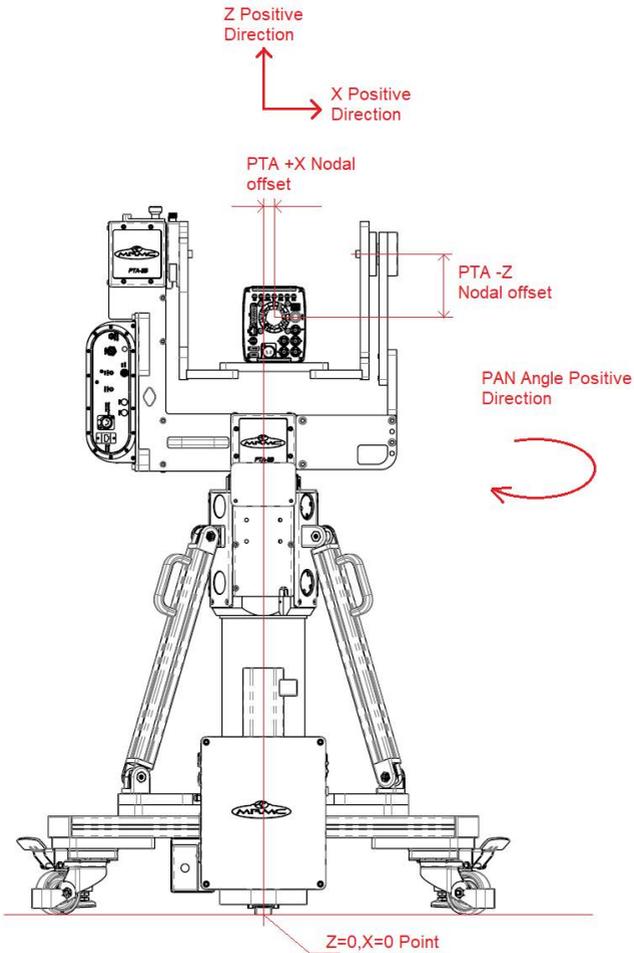

Setting up X, Y and Z nodal offset on PTA-2

Note

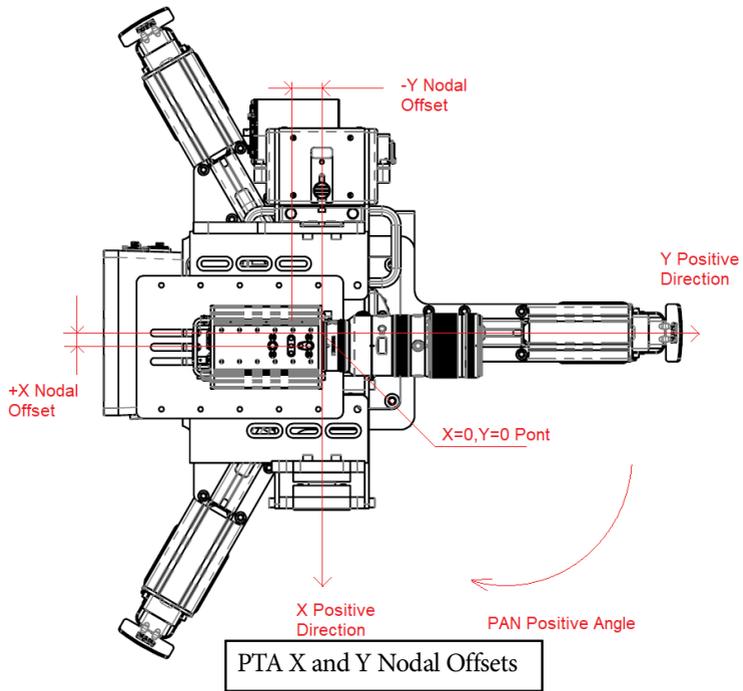

The X, Y and Z Nodal offsets are to be measured with respect to the camera sensor.

Use the following drawing to measure the X and Z Nodal offsets on the PTA-2 head. Note that the positive Z direction is upwards and positive X is on the right.

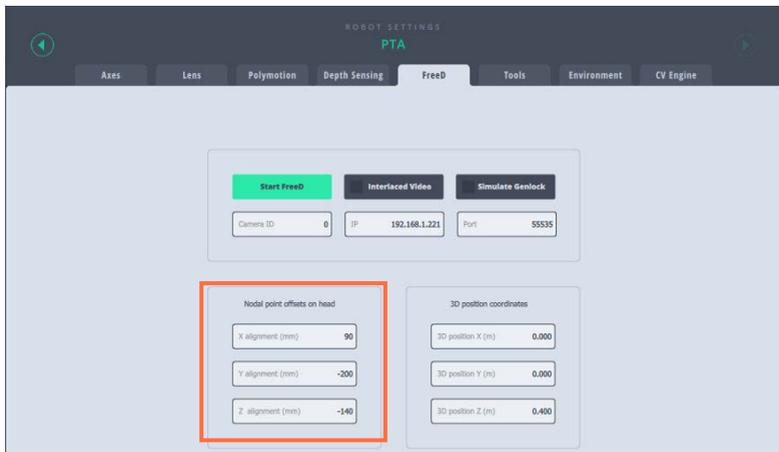

PTA X and Z Nodal Offsets

Use the following drawing to measure the Y Nodal offsets on the PTA-2 head. Note the positivity of Y direction.

Following is an example of the PTA Nodal offsets in MHC.

Advanced FreeD Box's screen overview

Button	Function
1	Toggle between the screens on the FreeD box display
2	Save settings
3	Start/stop the FreeD box
4	Not used

FreeD box Screen 1

FreeD box Screen 2

FreeD box Screen 3

Screen showing below can be useful to doublecheck that system is setup properly and running.

SRC1 Freq. indicates that FreeD Source 1 (which is the head) is transmitting FreeD packets with a indicated frequency. It also means that the head is receiving sync signal on its genlock input. (Assuming sync simulation is turned off).

SRC2 Freq. indicates that FreeD Source 2 (which is the SLH column) is transmitting FreeD packets with a indicated frequency. It also means that SLH is receiving sync signal on its genlock input. (Assuming sync simulation is turned off).

Sync Freq. is a test feature that can be used to check if sync signal is present in the coax sync cable plugged into advanced sync box. Note that Advanced sync box does not require sync signal supplied to it.

FreeD box Screen 4

FreeD box Screen 5

After the entire system is setup properly in that user interface is used to run or stop 2D scanner in order to get positional data for the SLH+PTA-2 system. After positional data have been acquired (may take 10s to settle) button SAVE can be used to save current position. That position will be saved and system position will be known even after power off/on cycle. If SLH was moved while 2D scanner was off it will be required to run scanner again to update (and SAVE) new current position.
